

# FORECAST OF THE STATE POPULATION BY AGE AND SEX: 1990 TO 2030

NOVEMBER 2003 FORECAST

## Technical Notes

---

The 2000 census population by age and sex, actual vital events through December 31, 2002, and the April 1, 2003 estimate of the state's population are utilized as the starting point for the forecast of Washington State population through 2030.

1. The estimates for 2002 through 2003 and the forecast are based on Census 2000 population counts by age and gender. Revised estimates for 1991 through 1999 are also provided. The revised series is based on the 1990 and 2000 census counts and data that track annual change through the decade.
2. The **natural increase** component of population change includes actual vital events through December 2002. Forecast fertility and mortality assumptions track with Bureau of the Census assumptions with adjustments made for Washington. A 1990 decennial Washington State life table is used to survive the population. Projections of life expectancy are based on Table B-1 in *Current Population Reports*, Series P-25, No. 1104, November 1994, U. S. Bureau of the Census. Age-specific fertility projections are based on Table-1 in *Current Population Reports*, Series P-25, No. 1104, November 1994, U. S. Bureau of the Census.
3. Forecasts of near-term and long-term **net migration** are based on an econometric model relating net migration to the relative performance of Washington's traded sectors—in terms of employment change—to that in California and the rest of the nation. The Economic and Revenue Forecast Council, State of Washington (September 2003) and Global Insight (formerly DRI-WERA) provide the economic data used for the net migration forecast. Historical migration rates are also used to develop long-range (beyond 2009) migration expectations. Near-term migration, through 2008, is based strictly on the model. Please consult the migration section for more details concerning the model.

The distribution of net migrants by age and sex is primarily derived from intercensal (1990-2000) estimates of the age-sex structure of migration for Washington State.

At present, there is very little difference near-term difference in the forecasts prepared in the fall of 2001, 2002, and 2003. By 2007, the state population in the 2001 forecast is 6,388,804 compared to 6,389,485 in the 2002 forecast, and 6,389,505 in the current forecast.

## General Discussion of State Growth

---

Washington's population has increased by about 20 percent per decade from 1960 through the year 2000—adding a total of 1,027,000 over the 1990s. State growth, which slowed in the late 1990s, temporarily rebounded from an annual change of 63,000 in 2000 to 80,800 in 2001, and then dipped to 56,590 by 2003. Growth is expected to remain relatively slow through 2005 and then gradually rise to 80,000 or more per year by 2008.

### Washington State shows strong historical population growth.

OFM FORECASTING DIVISION

NOVEMBER 2003

Near-term population growth assumptions for Washington should be considered somewhat tentative. Numerous factors could intervene to hasten or impede state and national economic recovery. Current growth levels appear heavily dependent on California's economic well-being.

High and low long-term growth alternatives were prepared as part of the Growth Management Population Projections package in January 2002. These projections are available and remain valid because of the minimal difference between the 2002 and 2003 state levels forecasts.

The following sections discuss the specific components of population change.

## Components of Population Change: 1990 to 2030

	Population At End Of Period	Population Change Number	Population Change Percent	Components of Change from Previous Period							
				Births		Deaths		Natural Increase		Net Migration	
				Number	Rate	Number	Rate	Number	Rate	Number	Rate
1990-1991	5,021,335	154,643	3.18	79,076	15.99	36,575	7.40	42,501	112,142	22,68

November 3, 2003

## Population and Components of Change

---

The components of population change are births, deaths, and migration. The excess of births over deaths is called natural increase. Persons moving to Washington (in migration) minus persons leaving the state (out migration) result in net migration. The table on the facing page shows the components of population change for 1991 through 2030. Births from 1990 through 2002 are actual vital events.

**Natural increase will continue to be an important source of population growth.**

OFM FORECASTING DIVISION

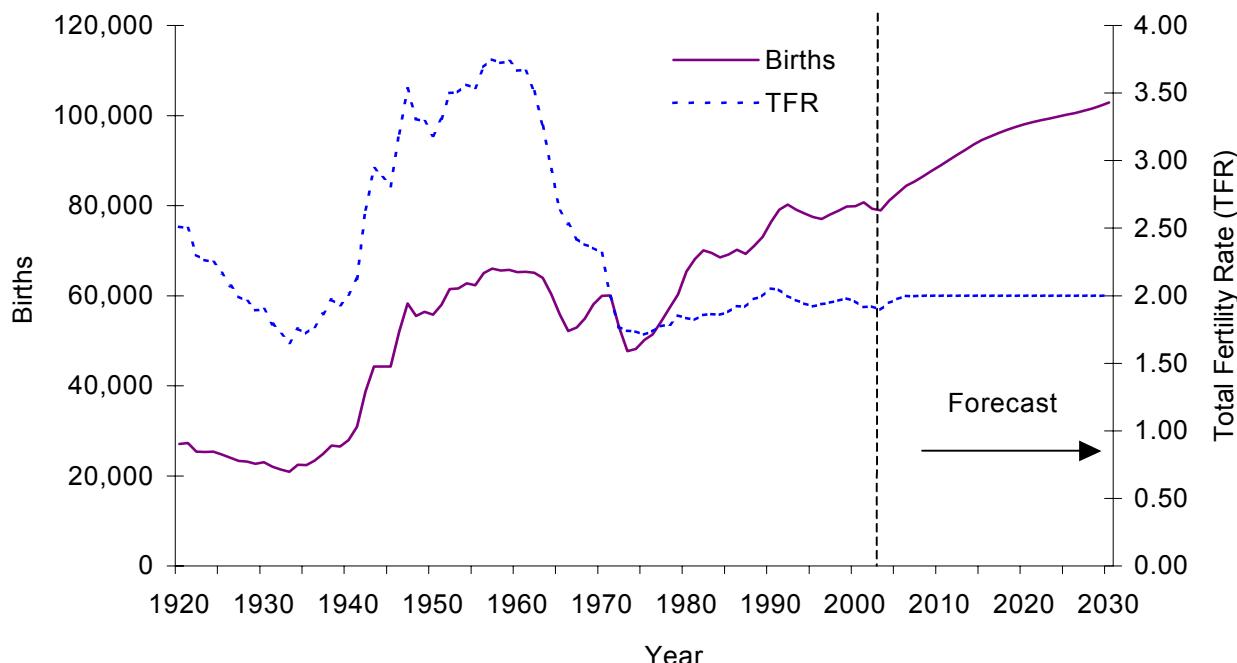

NOVEMBER 2003

## Fertility

Historic fertility levels in Washington, as in the nation, have followed a roller coaster pattern. However, since the mid-1980s, the state's total fertility rate (TFR)—the average number of births per woman—has remained relatively constant. The average number of births per woman is actually a hypothetical value. It is the average lifetime births expected by a group of women if they followed the age-specific birth rates for a given year.

Actual birth levels in Washington increased and then stabilized as the Baby Boom generation aged to have children. Births are expected to rise again as this new group of youngsters reach adulthood and begin their families. Thus, even though total fertility is expected to remain relatively constant, changes in the number of women of childbearing age will continue to cause some fluctuation in fertility levels. The following outline shows some of the historic fertility peaks and valleys and briefly addresses the current downturn in fertility rates.

**Number of births per woman is expected to be low but a large number of women will have children between 1990 and 2030.**

OFM FORECASTING DIVISION

NOVEMBER 2003

Year	Social and Economic Climate	Number of Annual Births	Average Number of Births Per Woman
1933	Bottom of the Depression	20,800	1.6
1957	Peak of Baby Boom, economic prosperity	65,900	3.7
1975	Increases in working women, increased age at first marriage, and delayed childbearing.	49,500	1.7
1980s	Children of the Baby Boomers reach adulthood.	68,000 to 71,000	1.8 to 2.0
Early 1990s	Slight rise in fertility rates, delayed first/or second births recognized.	79,000 to 80,000	2.0 to 2.04
Late 1990s to 2002	Modest fluctuations in fertility levels. Fewer women in peak childbearing age. Birth rates show a marked decline in 2002 for nearly every five-year age group. This may be recession related, but it is uncertain at this time.	77,000 to 79,800	1.93 to 1.97
-----Forecast-----			
2003-2030	Fertility levels follow U.S. Census Bureau national forecast assumptions with downward adjustment for Washington. This forecast may need further downward adjustment if downward trend continues.	Births decline in 2002 and 2003 and then gradually increase from 78,000 to 102,000 by 2030	1.91 to 2.00

If women were currently having children at birth rates comparable to the Baby Boom years—births would total 145,000 births per year. By the year 2030 there would be nearly 200,000 births per year. There is no indication that high fertility rates will return—not given the high level of women's participation in the labor force, delayed marriage, and delayed childbearing after marriage.

## Mortality

The first half of the 1900s saw dramatic improvements in nutrition and health care that reduced infant deaths and markedly increased life expectancy. After that time, gains in infant health and life expectancy continued, but at a slower pace. Infant death rates are now quite low. Bureau of the Census research indicates that from the late 1990s forward, no medical breakthroughs are anticipated that will greatly increase life expectancy. Gains in life expectancy are expected to come from improved maternal health care, lifestyle changes, and treatment of hypertension.

The following outline shows improvements in life expectancy over time and future expectations.

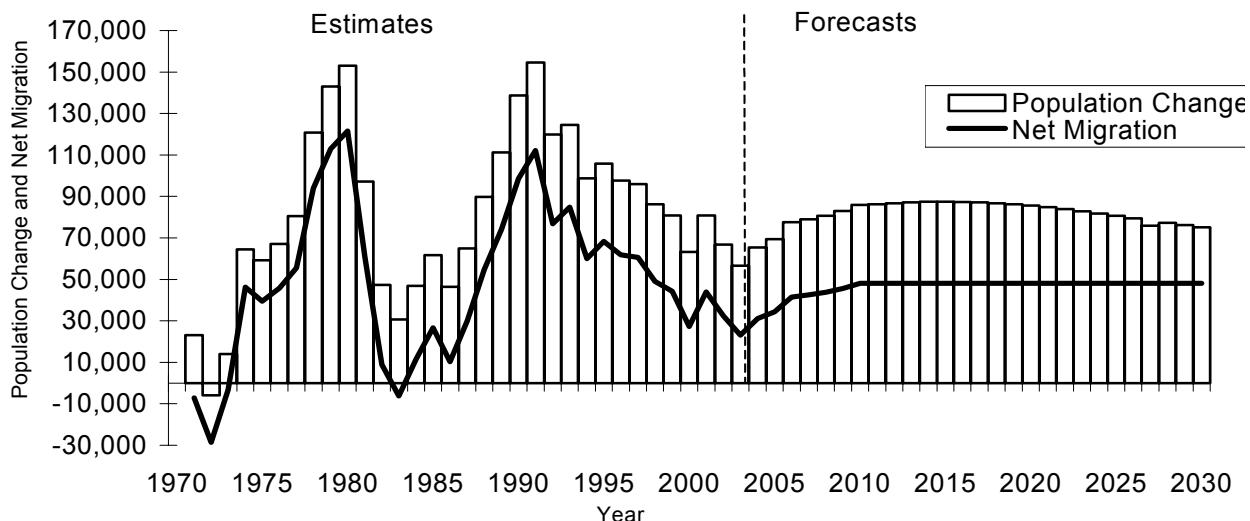

<b>Year</b>	<b>Infant Mortality/Comments</b>	<b>Number of Annual Deaths</b>	<b>Life Expectancy in Years</b>	
			<b>Male</b>	<b>Female</b>
1920s	Large proportion of deaths to infants in first year of life—approximately 56 per 1,000.	15,000	58	60
1960	Major advances in nutrition and medicine occurred between 1920 and 1960. Infant mortality reduced to 23 per 1,000.	26,500	68	75
1980	Infant mortality reduced to 12 per 1,000.	32,000	72	79
Late 1990s through 2002	Large improvements in life expectancy unlikely. Infant mortality 8 per 1,000.	43,000 to 44,000	74	80
	-----Forecast-----			
2005	Forecast follows U.S. Census Bureau's recent national forecast assumptions.	47,600	75	81
2015		55,200	76	82
2025		67,600	77	83
2030		75,900		

## Migration

Migration, the most variable component of population change, is largely an economic phenomenon relating to push and pull factors. Migration usually varies as the result of changing economic conditions in Washington relative to other states. Some migration, such as military movements or the migration of retired persons, is not economic.

Annual migration is developed separately for three time periods: (1) historical and current estimates, (2) near term projections, and (3) long term projections.

**Net migration is a major contributor to population change in Washington State.**

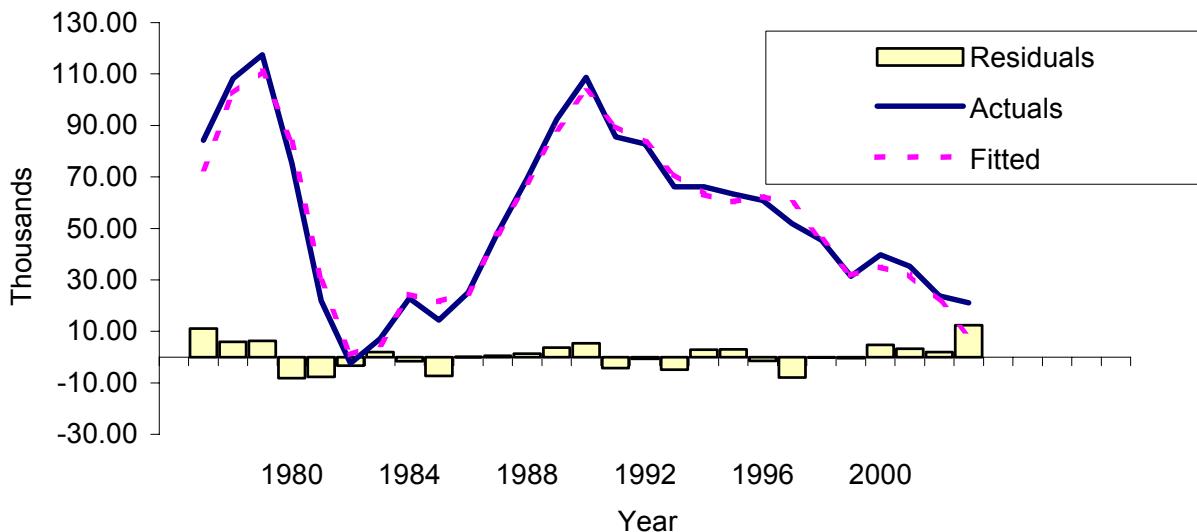

OFM FORECASTING DIVISION

NOVEMBER 2003

Year(s)	Method	Distinguishing Characteristics Of Method	Data and Assumptions (if applicable)
1990 through 2000	Census and Intercensal Estimates (Provisional)	<i>Decade population change from census counts with estimates of annual change based on actual change in symptomatic data</i>	School enrollment and housing
2001 through 2003	Estimates	Developed from Component Method II, the Housing Unit Method, and Regression	School enrollment, housing, vital events, auto, registration, voters, drivers licenses, Medicare data, and others
2004	Estimate (Provisional)	Developed from Component Method II	Provisional school enrollment, vital events, and Medicare.
2004 through 2009	Near-term Projection	Migration forecast is based on an econometric model relating net migration to the performance of Washington's change in traded sector employment compared to that in California and the rest of the nation. <i>The first year of the near-term projection model overlaps the 2004 provisional migration and is consistent with the provisional population estimate for 2004.</i>	Economic and Revenue Forecast Council (Sept. 2003) Employment forecasts and October 2003 Global Insight (formerly DRI-WERA) forecasts for the U.S. and California. The strength of Washington's traded sector job growth is forecast to be stronger than California's from 2005 through 2009.
2010 through 2030	Long-term Projection	Developed from the regression model and historical migration trends. <i>Results expressed as average annual migration.</i>	OFM Long-term employment forecasts. Washington's traded sector and producer services employment is expected to outperform the U.S. and California.

## Comparison of actual and predicted net migration using OFM's model, 1970-2003.

OFM FORECASTING DIVISION

NOVEMBER 2003

*Projected migration is modeled with econometric techniques that integrate economic performance expectations with population outcomes by quantitatively relating changes in traded sector employment to net migration.* Briefly, the model specifies that the level of total net migration is determined by:

- The relative growth of “traded sector” employment in Washington State to that in California.
- The relative growth of “traded sector” employment in Washington State to that in the rest of the nation
- A national recession indicator.

“Traded” industries include manufacturing, federal civilian government, and producer services (services purchased by businesses). Changes in state traded sector employment are closely associated with varying levels of net migration over time.

The forecast input data comes from OFM’s long-term forecast of the state traded sector employment, the Office of Forecast Council’s September 2003 short-term economic forecast for the state, and the Global Insight’s (formerly DRI-WEFA) October 2003 economic forecast for the U.S. and California. A projection for California’s employment past 2009 was not available at the time Washington’s population projection needed to be completed. The migration forecast may be subject to revision given any major changes in the economic factors affecting population movement.

The long-term projection developed last year’s was retained for 2010 through 2030 because long-term employment projections were not available for California. This long-term projection, based on employment variables, is also consistent with Washington historical net migration

performance. Assumptions in *long-term employment expectations* that determine migration are specified below.

- **Washington is expected to out-perform the U.S. in the growth of the traded sector employment.** This makes Washington an attractive place, economically speaking, for potential migrants.
- **Growth in manufacturing employment in Washington is expected to perform better than in the U.S. and California.** The forecasts for California and the U.S. show a long-run decline in manufacturing employment. In Washington, manufacturing employment is predicted to maintain a small but positive rate of growth. Historically, manufacturing employment in Washington, excluding aerospace and lumber and wood products, has always grown faster than in the U.S. This trend is expected to continue.
- **Employment growth in traded services in Washington is expected to perform better than the U.S. traded services employment in the early years of the forecast.** Historically, Washington has experienced significantly faster employment growth in producer services than the U.S. This is expected to continue with the difference declining. In the last ten years of the forecast period, the producer services sector in Washington is projected to grow at about the same rate as the U.S.

## Population in Selected Age Groups

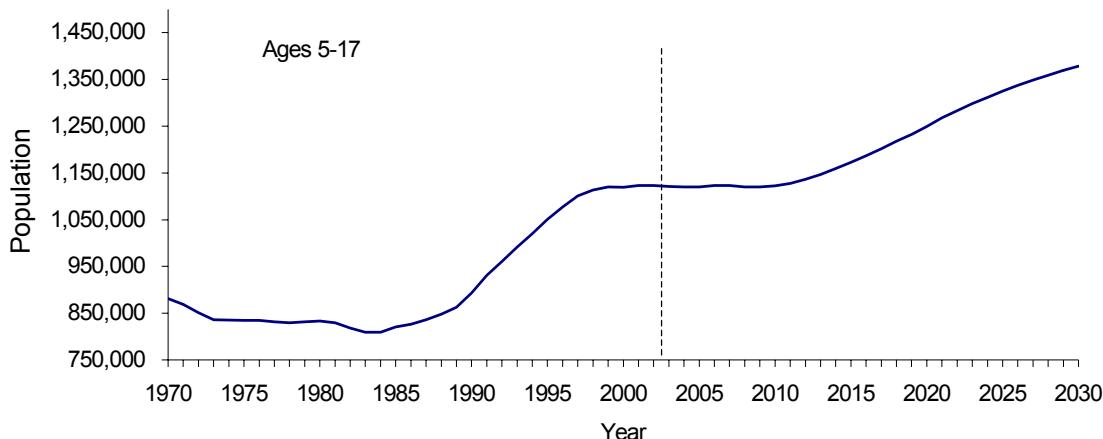

---

Changes in the number of persons in selected age groups will place new demands on and make new contributions to society, the economy, and government. Of special interest are: children ages 5 through 17; young adults ages 18 through 24; various groups of working-age adults, ages 18 through 64; and the elder population, ages 65 and over.

### School-Age Children

There are an estimated 1,121,100 youngsters aged 5 to 17 in 2003. This school-age population will remain essentially stable through 2010 and then begin to increase as the "Baby Boom echo" children reach childbearing age.

**The school-age population will remain relatively stable in the early part of the forecast and then continue to growth after 2010.**

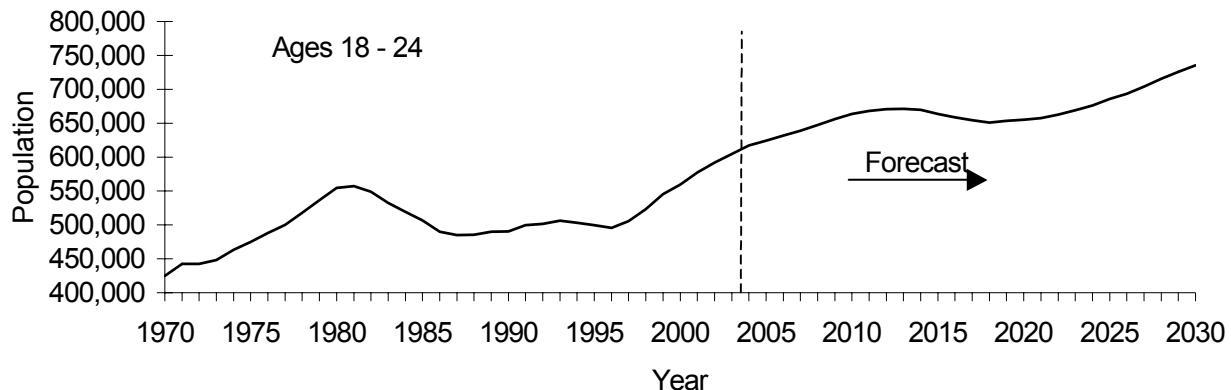

OFM FORECASTING DIVISION

NOVEMBER 2003

### Young Adults

After a long-term decline, the number of young adults ages 18 to 24 began to increase in 1997. There are an estimated 604,300 persons age 18 to 24 in 2003. This age group has now exceeded its 1981 peak of nearly 560,000 and will continue increasing for the next ten years—reaching 670,000 by 2013. Post-secondary educational institutions should experience enrollment pressure as the size of this young adult population increases. This post-secondary education age group will then decline through 2020 before it begins to rise again.

**Young adults reached a low in 1996 and started to grow steadily through 2012.**

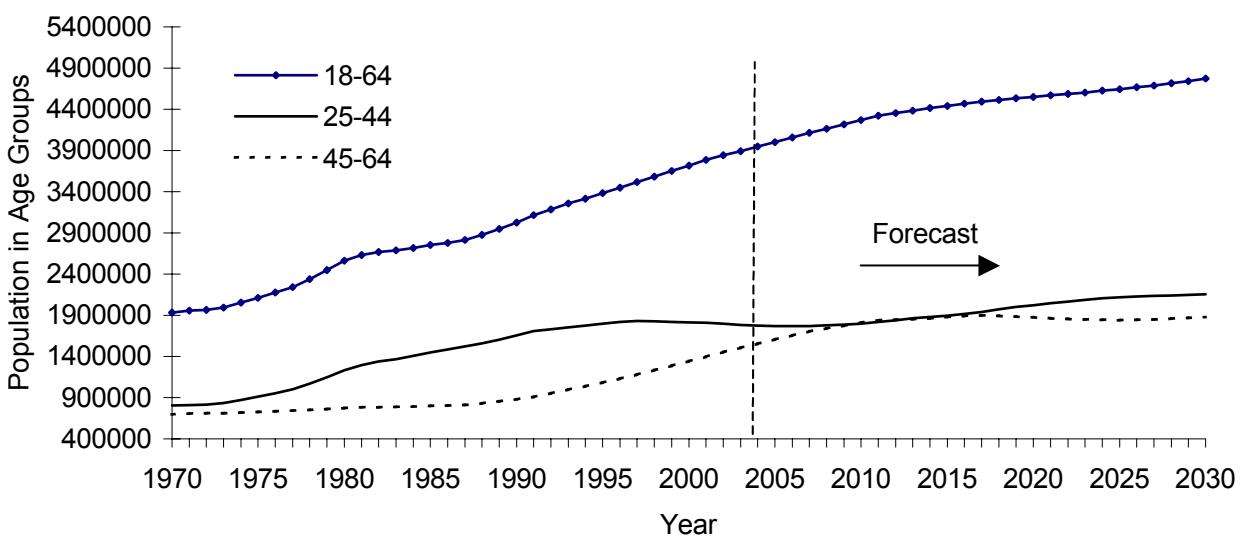

OFM FORECASTING DIVISION

NOVEMBER 2003

## Working Age Adults

Persons 25 to 44, totaling 1,782,200 in 2003, should exceed 2 million by 2020. Older workers, persons between 45 and 64, will grow by nearly half a million in less than 20 years as the Baby Boom generation ages – from 1,505,100 in 2003 to a peak of 1,897,500 in 2017.

**Working-age adults in their prime earning years will increase in number.**

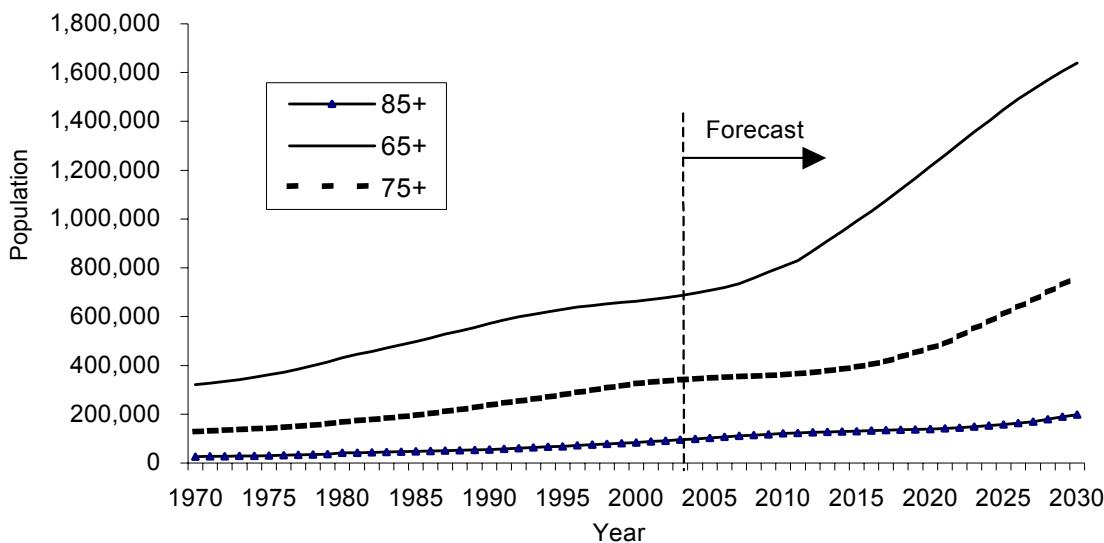

OFM FORECASTING DIVISION

NOVEMBER 2003

## Elderly Population

Washington's population age 65 and over, estimated at 686,400 in 2003, is expected to reach 806,500 by 2010 and 1.2 million by the year 2020. The population age 75 and over shows the most rapid growth after 2015 when the Baby Boom generation has its impact. Persons age 85 and over are estimated at 95,000 in 2003 and are expected to reach 139,300 by 2020, and nearly 200,000 by 2030.

**The elderly population will grow rapidly after 2005.**
